

**CLAIMS**

1. Telecommunications system including a database intended to be connected to at least one terminal by means of a communication network, the said database including a so-called reference server, intended to contain data associated with at least one domain name, and at least one first and one second auxiliary server intended to contain data previously recorded within the reference server and respectively provided with a first and second degree of confidentiality, at least one of the first and second auxiliary servers being provided with identification means for preventing any access to the data that it contains by terminals not having access authorisation compatible with the degree of confidentiality attributed to the data contained in this auxiliary server.

2. Telecommunications system according to claim 1, characterised in that the database is provided with means of duplicating the data contained in the reference server to the first and second auxiliary servers according to the degrees of confidentiality attributed to the said data.

3. Telecommunications system according to one of claims 1 or 2, characterised in that the first and second auxiliary servers are provided with identification means to prevent any access to the data contained in the first and second auxiliary servers by terminals not having access authorisations respectively compatible with the first and second degrees of confidentiality.

4. Telecommunications system according to one of claims 1 to 3, characterised in that the reference server is provided with identification means for preventing of any reading of data contained in the said reference server from terminals not having access authorisation compatible with the third degree of confidentiality.

5. Telecommunications system according to one of claims 1 to 4, characterised in that the third degree of confidentiality has a restrictive effect greater than the restrictive effects produced by the first and second degrees of confidentiality.

6. Telecommunications system according to one of claims 1 to 5, characterised in that the reference server is provided with identification means for preventing any writing of data in the said reference server from a terminal not having access authorisation compatible with a greater degree of confidentiality having a restrictive effect greater than the restrictive effect produced by all the other degrees of confidentiality attributed to the data contained in the reference server and the auxiliary servers.

7. Device for storing information including a so-called reference **server** and at least a first and second auxiliary server intended to contain data previously recorded within the reference server and respectively provided with a first and second degree of confidentiality, at least one of the first and second auxiliary servers being provided with identification means for preventing any access to the data that they contain by applicants not having access authorisation compatible with the degree of confidentiality attributed

to the data contained in this auxiliary server.
